18

19 **Manuscript type:** Short Communication

20

21 **Abstract**

22 Bioacoustic information is an essential tool for anuran identification, especially  
23 cryptic species. We present the first description of the acoustic characters of  
24 *Leptobrachella suiyangensis* and *Leptobrachella bashaensis*. The findings aim to  
25 inform future ecological studies on species and taxonomy in the genus *Leptobrachella*.  
26 Recordings were obtained in the Huoqiuba nature reserve and Basha nature reserve,  
27 China. The advertisement calls of *L. suiyangensis* mainly include monosyllabic calls  
28 and polysyllabic calls, which can be divided into four types. The call of *L.*  
29 *suiyangensis* has a mean dominant frequency of  $4.51 \pm 0.16$  kHz ( $n = 322$ ). *L.*  
30 *bashaensis* has only one type of advertisement call. The advertisement call of *L.*  
31 *bashaensis* comprises a single note with a mean call duration of  $66.01 \pm 6.86$  ms and  
32 a mean dominant frequency of  $6.16 \pm 0.08$  kHz ( $n = 100$ ). We compared the  
33 advertisement calls of other congeners of *L. suiyangensis* and *L. bashaensis* as these  
34 species share similar morphological characteristics and close genetic distance. Despite  
35 a high degree of morphological similarity between these species, their advertisement  
36 calls differ significantly. Furthermore, different types of calls in the genus  
37 *Leptobrachella* and the definitions of primary advertisement calls and secondary  
38 advertisement calls are discussed. The study provides basic data for further acoustic  
39 and taxonomic studies on *Leptobrachella*.

42

## 43 **Introduction**

44 The acoustic behavior of amphibians has been commonly studied and plays an  
45 important role in species reproduction, evolution, and interspecific identification  
46 (Cunningham and Birkhead 1998; Brenowitz and Rose 1999; Kelley 2004).  
47 Vocalization is the main communication mechanism of Anura amphibians at the  
48 interspecific and intraspecific levels (Wells 2007; Köhler et al. 2017). To better study  
49 the vocal communication-related behaviors of frogs, researchers have divided frog  
50 calls into the following five types: courtship calls, advertisement calls, aggressive  
51 calls, release calls, and distress calls (Wells 1997; Tobias et al. 2004). Advertisement  
52 calls are the main vocal type of Anura amphibians, which has specificity and changes  
53 greatly among different species and can be used as the basis for systematic  
54 classification (Gerhardt 1994; Sullivan et al. 1996). Hence, advertisement calls are  
55 widely used in taxonomic research (Goicoechea et al. 2010; Wijayathilaka et al. 2016).

56 The Asian leaf litter toads of the genus *Leptobrachella* (Smith, 1925) are a group  
57 of forest-dependent species, widely distributed in Southeast Asia and southern China  
58 (Frost 2023; AmphibiaChina 2023). Given the low dispersal abilities of the species, a  
59 genus is an ideal group for investigating patterns of diversity and discerning the  
60 drivers of speciation. *Leptobrachella* contains 99 species that inhabit hilly evergreen  
61 forests throughout Southeast Asia, southern China, and northeastern India (Frost  
62 2023). Many of the species are threatened with extinction, such as the critically  
63 endangered *L. botsfordi* (IUCN 2021). A high degree of morphological similarity and  
64 rampant homoplasy appears to have misled the estimates of diversity and  
65 evolutionary relationships (Chen et al. 2018). Thirty-seven species of *Leptobrachella*  
66 have been described in the last five years, accounting for 37.8% of the total number of  
67 species in this genus (Frost 2023; AmphibiaChina 2023). Despite this considerable

68 rate of discoveries and publications, a large percentage of the vocalizations of  
69 *Leptobrachella* individuals remains unknown (Yeung et al. 2021). Both  
70 *Leptobrachella suiyangensis* and *Leptobrachella bashaensis* were described in 2020  
71 but so far, their advertisement calls have not been reported (Luo et al. 2020; Lyu et al.  
72 2020). Although the conservation status of *L. suiyangensis* and *L. bashaensis* has not  
73 been evaluated by the International Union for Conservation of Nature (IUCN) Red  
74 Lists, they are expected to be endangered species, since the area of occupancy and/or  
75 their extent of occurrence is very small. In this study, we describe for the first time the  
76 advertisement calls of *L. suiyangensis* and *L. bashaensis*. Furthermore, we also  
77 collated and compared these results with the call of congeners of *L. suiyangensis* and  
78 *L. bashaensis*, since it is a species group with high morphological similarity and close  
79 genetic distance.

80

## 81 **Material and Methods**

### 82 *Call recordings*

83 The advertisement calls of *L. suiyangensis* and *L. bashaensis* were both recorded from  
84 their type locality. A total of 322 calls were recorded from four individuals of *L.*  
85 *suiyangensis*, collected from the Huoqiuba Nature Reserve (E 107.08 °, N 28.47 °,  
86 1,448 m, 15.7 °C air temperature, 93% ambient humidity) on April 27, 2022, between  
87 19:00–23:00 and 100 calls from three *L. bashaensis* individuals collected at Basha  
88 Nature Reserve (E 108.39 °, N 25.63 °, 978 m, 16.3 °C air temperature, 83% ambient  
89 humidity) were recorded on May 1, 2022, between 19:00–20:00h. Calls of each  
90 individual were recorded using a digital recorder, SONY ICD-PX470 (sampling rate  
91 44.1 kHz, 16-bit resolution). Each call was recorded within a 0.5 m distance from the  
92 calling individual. The recording duration was 1–4 min for all individuals. Recorded

93 calls were always of isolated individuals and never from a mixed chorus. The  
94 recordings were saved as Wav files. Snout vent lengths (SVLs) of all recorded males  
95 were measured in situ using a precision digital caliper to the nearest 0.01 mm; one  
96 specimen from each population was taken as a reference and all other animals were  
97 released back to their original habitat following measurement. After taking  
98 photographs, they were euthanized using isoflurane and then the specimens were  
99 fixed in 10% buffered formalin. Tissue samples were taken and preserved separately  
100 in 95% ethanol prior to fixation. Specimens were deposited in the Forestry College of  
101 Guizhou University, China. Mitochondrial 12S rRNA and 16S rRNA genes were  
102 extracted and amplified from muscle samples of all samples and sequenced. The  
103 sequencing results were compared to finally determine the species collected. For the  
104 morphological identification of specimens, the procedure described by Luo et al.  
105 (2020) and Lyu et al. (2020) was followed.

106

### 107 *Acoustic analyses*

108 Only calls that had a high signal-to-noise ratio and were free from overlapping calls  
109 of nearby males were used for the analysis. For each recording, first, Adobe Audition  
110 2020 audio editing software was used to reduce noise under default settings. We  
111 measured all parameters and characteristics following the procedure described by  
112 Köhler et al. (2017) and Yeung et al. (2021) including (1) call duration (ms), CD (2)  
113 dominant frequency (kHz), DF (3) note per call, NPC (4) first note pulse number, first  
114 NP (5) second note pulse number, second NP (6) inter-note intervals, NI (7) first note  
115 duration, first ND (8) second note duration, second ND (9) inter-call intervals, CI, and  
116 (10) pulse (repetition) rate, PR (Table 1). Raven Pro 1.6 was used to measure the call  
117 characteristics; temporal call characteristics were measured using Raven's waveform

118 display and spectral properties were measured by averaging the spectrum over the  
119 entire duration of a call (256 pt. fast Fourier transform, Hanning window).  
120 Oscillograms, spectrograms, and power spectra were graphed in the Seewave R  
121 package (Sueur et al. 2008). Descriptive statistics of call characteristics; mean,  
122 standard deviation (SD), and range were computed using SPSS 23.0.

123

## 124 **Results**

### 125 ***Leptobrachella suiyangensis* Luo, Xiao, Gao and Zhou, 2020**

126 The recorded males were calling on rocks in streams, with shrubs and bamboo forests  
127 growing nearby. The advertisement calls of *L. suiyangensis* mainly included  
128 monosyllabic calls and multisyllabic calls, which could be divided into two types,  
129 respectively. Therefore, the advertisement calls of *L. suiyangensis* could be divided  
130 into four types (Fig. 2, Table 2, 4). Type A (n = 3) included the monophonic calls  
131 from two male individuals (specimen number: SY20220427003 and SY20220427004,  
132 Table 4), and the call duration ranged from 25.30–64.70 ms; the mean call duration  
133 was  $47.57 \pm 20.20$  ms. The dominant frequency ranged from 4.13–4.82 kHz; the  
134 mean dominant frequency was  $2.39 \pm 0.16$  kHz. The mean pulse number was four,  
135 with a mean pulse rate of  $47.61 \pm 8.77$  pulses/second. Type B (n = 136) was a  
136 monosyllabic call. All four individuals emitted Type B vocals. Call duration ranged  
137 from 209.10 to 382.70 ms with a mean call duration of  $291.47 \pm 31.59$  ms. The mean  
138 interval between call duration was  $422.64 \pm 154.88$  ms. The mean dominant  
139 frequency was  $4.49 \pm 0.15$  kHz. The mean pulse number was  $24.00 \pm 2.50$ , with a  
140 mean pulse rate of  $75.75 \pm 14.83$  pulses/second. Both type C (n = 138) and type D (n  
141 = 45) vocalizations were multisyllabic calls containing two syllables. All four  
142 individuals emitted type C vocals, while only three individuals (specimen number:

143 SY20220427003, SY20220427004, and SY20220427005, Table 4) produced type D  
 144 vocals. The call duration of type C ranged from 138.30 to 284.60 ms, and the mean  
 145 call duration was  $179.49 \pm 37.56$  ms. The mean dominant frequency was  $4.47 \pm 0.13$   
 146 kHz. The mean inter-call interval was  $164.43 \pm 25.60$  ms. The call duration and inter-  
 147 call interval were regular and shared the same dominant frequency with type A and  
 148 type B in a call series. Type D ( $n = 45$ ) vocalizations had the longest call duration,  
 149 with a mean call duration of  $302.22 \pm 50.97$ , ranging from 220.50 to 442.00 ms. The  
 150 mean dominant frequency was  $4.67 \pm 0.16$  kHz, slightly higher than the dominant  
 151 frequency of the other three call types.

152

153 ***Leptobrachella bashaensis* Lyu, Dai, Wei, He, Yuan, Shi, Zhou, Ran, Kuang, Guo,**  
 154 **Wei and Yuan, 2020**

155 Recorded males perched on shrubs 0.5–1 m above the ground or were calling on  
 156 rocks in streams. The advertisement call of *L. bashaensis* comprised a single note  
 157 with a mean call duration of  $66.01 \pm 6.86$  ms, ranging from 48.00 to 79.80 ms (Fig. 3;  
 158 Table 3). The mean dominant frequency was  $6.16 \pm 0.08$  kHz, ranging from 6.03 to  
 159 6.46 kHz. The mean inter-call interval was  $334.59 \pm 65.61$  ms. The mean pulse  
 160 number was  $3.00 \pm 1.00$ , with a mean pulse rate of  $34.40 \pm 4.46$  pulses/second.

161 We describe for the first time the spectral and temporal parameters of the  
 162 advertisement call of *L. suiyangensis* and *L. bashaensis*. The former was assigned to  
 163 the *L. oshanensis* species group (Luo et al. 2020; Liu et al. 2023). *L. bashaensis* is  
 164 nested in the *L. liui* species group, and its genetic distance from *L. suiyangensis* was  
 165 far (Lyu et al. 2020). Although *L. suiyangensis* is morphologically similar to *L.*  
 166 *bashaensis*, these species with similar morphological characteristics differ in the call  
 167 structure of their advertisement calls. *L. suiyangensis* emitted several call types while

168 *L. bashaensis* emitted only one (Fig. 2, 3). The advertisement calls of *L. suiyangensis*  
169 include monosyllabic and multisyllabic calls, while *L. bashaensis* only produced  
170 monosyllabic calls.

171 The calls of *L. bashaensis* were simpler, with fewer pulse numbers. Finally, the  
172 dominant frequency in *L. suiyangensis* was significantly lower than that of *L.*  
173 *bashaensis*. The advertisement calls from the two compared species were similar to  
174 calling songs of orthopteran species (an onomatopoeic sound of a “Squeak”).

175

## 176 **Discussion**

177 The genus of *Leptobrachella* consists of 99 species worldwide (Frost 2023).

178 Approximately 34 species nest in the *L. oshanensis* species group and the *L. liui*

179 species group. The advertisement calls of 17 *Leptobrachella* species of the *L.*

180 *oshanensis* species group and the *L. liui* species group have been described (Xu et al.

181 2005; Fei et al. 2012; Rowley et al. 2017a, 2017b; Yang et al. 2018; Ding et al. 2019;

182 Wang et al. 2019; Li et al. 2020; Chen et al. 2021; Cheng et al. 2021; Shi et al. 2021;

183 Yeung et al. 2021; Liu et al. 2023) and there exists a significant difference in the

184 advertisement calls between the species in the *L. oshanensis* group and the *L. liui*

185 group. The advertisement calls of the *L. oshanensis* species group are relatively

186 complex (Table 5).

187 Most species of the *L. oshanensis* species group have multiple types of

188 advertisement calls; *L. oshanensis* has five types of advertisement calls (Shi et al.

189 2021) while *L. suiyangensis* has four types. A few species (*L. bijie*, *L. purpuraventra*,

190 *L. yae* etc.) have two types of advertisement calls (Wang et al. 2019; Shi et al. 2021).

191 In contrast, the advertisement call types of species in the *L. liui* species group are

192 simpler. For example, both *L. liui* and *L. bashaensis* have only one type of

193 advertisement call (Ding et al. 2019). The difference in *Leptobrachella* advertisement  
194 calls can help species identification rapidly in field investigations.

195 Most of the vocal characteristics can be explained by phylogenetic relationships  
196 and habitat occupation (Bosch and De la Riva 2004). Multiple studies have shown  
197 that differences in vocalizations between Anura can be elucidated through phylogeny  
198 (Mclean et al. 2013; Cocroft and Ryan 1995). For *Leptobrachella*, phylogenetic  
199 relationships seem to play a greater role than environmental influences. The *L.*  
200 *suiyangensis* belongs to the *L. oshanensis* species group. Previous studies have shown  
201 that the species in the *L. oshanensis* species group have more complex advertisement  
202 calls (Shi et al. 2021; Rowley et al. 2013). However, the genetic distance between *L.*  
203 *bashaensis* and *L. oshanensis* species group is far, and they are not in the same branch.  
204 Therefore, the call structure and type of *L. bashaensis* differ significantly from those  
205 of *L. oshanensis* species groups.

206 Among cryptic species, the use of acoustic diagnostic features for identification  
207 could be an alternative to morphometric and molecular diagnosis (Köhler et al. 2005;  
208 Vences and Köhler 2008). Although morphologically similar, *L. suiyangensis* and *L.*  
209 *bashaensis* have calls with different features, supporting the specificity of their  
210 acoustic signals at the species level. However, the magnitude of cryptic diversity and  
211 their advertisement calls remain largely unknown.

212 Due to the diverse types of advertising calls in the *Leptobrachella*, Rowley et al.  
213 (2013) defined for the first time the primary advertisement call (PACs) and secondary  
214 advertisement call (SACs). These terms have been used by Yeung et al. (2021). In  
215 general, the advertisement calls containing two types were defined as PACs and  
216 SACs, and the latter were similar to the dominant PACs in their note structures but  
217 with more notes per call and longer call durations, thus sounding to the human ear

218 like prolonged PACs (Rowley et al. 2013; Rowley et al. 2017a, 2017b). SACs are rare  
219 and irregular. In this study, we were unable to apply the terminology of PACs and  
220 SACs because most species of the *L. oshanensis* species group do not have two types  
221 of advertisement calls. Therefore, we cannot describe its advertisement call with  
222 simple PACs and SACs. Hence, whether PAC and SAC need to be redefined requires  
223 large amounts of data for verification.

224

## 225 **Acknowledgements**

226 We are grateful to editors and reviewers for their working on the manuscript. We also  
227 thank Dr. He-Qin Cao for assistance with the analyses. We would like to thank  
228 KetengEdit ([www.ketengedit.com](http://www.ketengedit.com)) for its linguistic assistance during the preparation  
229 of this manuscript. This work was supported by the Basic research project of Guizhou  
230 Province [ZK[2022]540]; Guizhou provincial science and technology development  
231 project (QKZYD [2022]4022); and The Science and Technology Bureau project of

352 **Table 1.** Descriptions of acoustic parameter measured.

<b>Parameter (units)</b>	<b>Discription</b>
Call duration (ms)	Time between onset of first pulse and offset of last pulse in a call.
Dominant frequency (kHz)	Maximum frequency using Raven’s selection spectrum function over the duration of the entire call.
Notes per call	The number of monosyllabic notes contained in a multisyllabic call.
First note pulse number	The number of pulses contained in the first note of a multisyllabic call.
Second note pulse number	The number of pulses contained in the second note of a multisyllabic call.
Inter-note intervals (ms)	The time interval between two adjacent notes.
First note duration (ms)	The duration of the first note in a multisyllabic call.
Second note duration (ms)	The duration of the second note in a multisyllabic call.
Inter-call intervals (ms)	The time interval between two adjacent calls.
Pulse (repetition) rate	Instantaneous pulse rate. Number of pulses repeated in a defined period of time within a note.

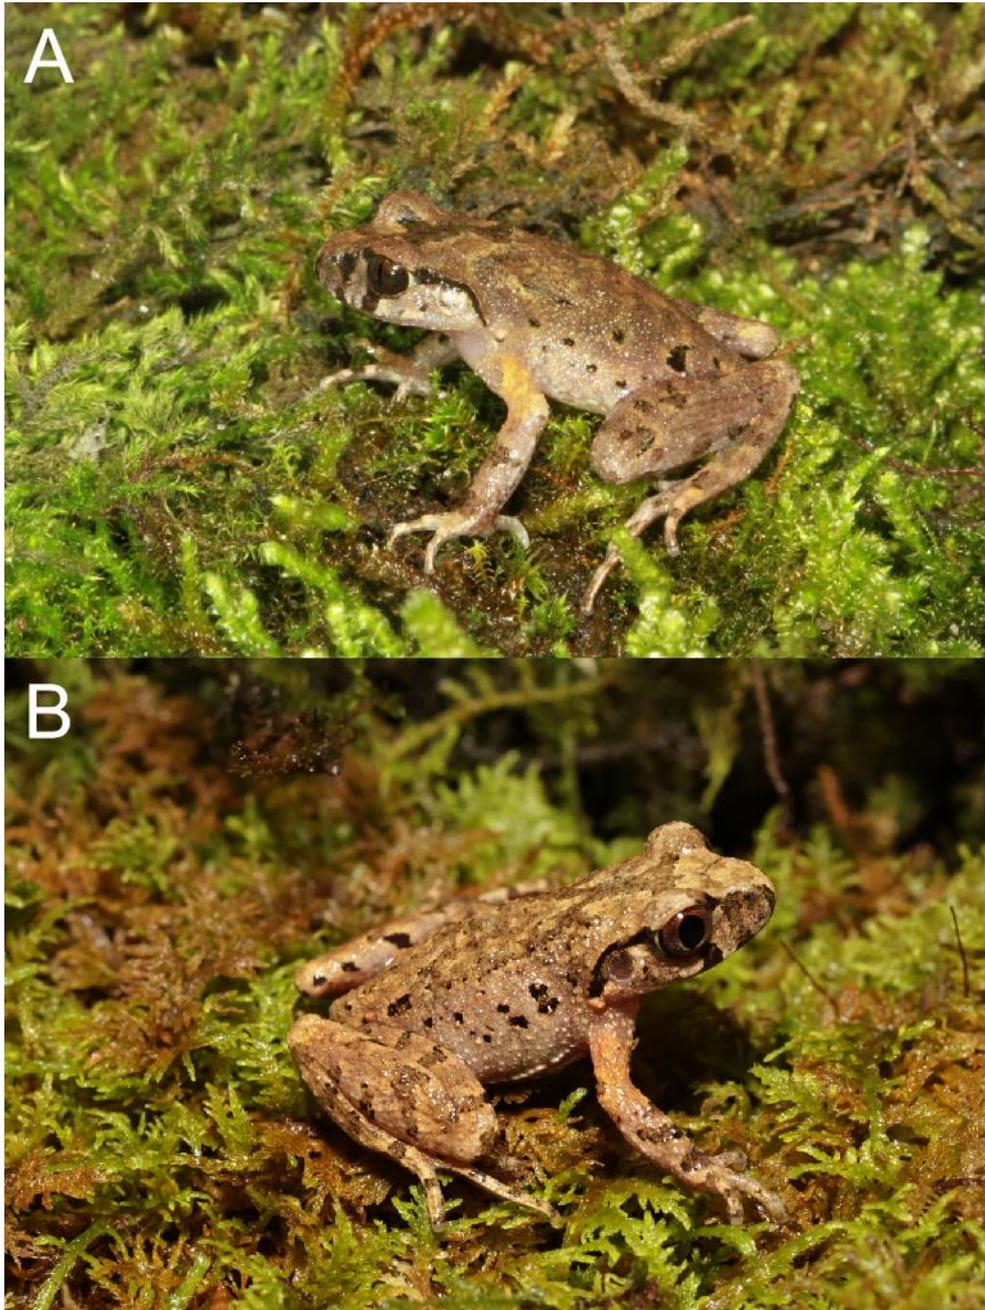

354 **Table 2.** Descriptive statistics for acoustic characteristics of advertisement calls of  
 355 *Leptobrachella suiyangensis*.

Call parameters	Call type			
	A (n = 3)	B (n = 136)	C (n = 138)	D (n = 45)
CD (ms)	47.57 ± 20.20	291.47 ± 31.59	179.49 ± 37.56	302.22 ± 50.97
	25.30 ~ 64.70	209.10 ~ 382.70	138.30 ~ 284.60	220.50 ~ 442.00
