The biodiversity of the nymphalid family (Insect, Lepidoptera): species collected in Romania's fauna between 1887-1984

Cristina Stancă-Moise, George Moise, Tom Brereton,  Mirela Stanciu**Disclaimer on biological nomenclature and use of preprints**

The preprints are preliminary versions of works accessible electronically in advance of publication of the final version. They are not issued for purposes of botanical, mycological or zoological nomenclature and **are not effectively/validly published in the meaning of the Codes**. Therefore, nomenclatural novelties (new names) or other nomenclatural acts (designations of type, choices of priority between names, choices between orthographic variants, or choices of gender of names) **should NOT be posted in preprints**. The following provisions in the Codes of Nomenclature define their status:

International Code of Nomenclature for algae, fungi, and plants (ICNafp)

Article 30.2: "An electronic publication is not effectively published if there is evidence within or associated with the publication that its content is merely preliminary and was, or is to be, replaced by content that the publisher considers final, in which case only the version with that final content is effectively published." In order to be validly published, a nomenclatural novelty must be effectively published (Art. 32.1(a)); in order to take effect, other nomenclatural acts must be effectively published (Art. 7.10, 11.5, 53.5, 61.3, and 62.3).

International Code of Zoological Nomenclature (ICZN)

Article: 21.8.3: "Some works are accessible online in preliminary versions before the publication date of the final version. Such advance electronic access does not advance the date of publication of a work, as preliminary versions are not published (Article 9.9)".

The biodiversity of the nymphalid family (Insect, Lepidoptera): species collected in Romania's fauna between 1887-1984

Abstract

Background

This paper complements the data published thus far about species of the nymphalid family with data collected in Romania's eight regions between 1887–1984 and elsewhere in Europe (Austria, Croatia, the Republic of Moldova, and Serbia), including the date and the site of original collection. For the first time, this research presents the collecting information of the species held in the entomological collection of the Museum of Natural History in Sibiu. It identifies the species of the nymphalid family in six of the museum's lepidoptera collections. These collections are of extraordinary interest not least because they are associated with natural scientists of European renown such as Daniel Czekelius, Eugen Worell, Viktor Weindel, Rolf Weirauch, Heinrich Hann von Hannenheim, and Eckbert Schneider. The analysis, cataloguing, centralization, and updating of the nomenclature resulted in a number of 1.865 specimens from 49 species and fifteen genera (of the 90 referenced in Romania's fauna): *Aglais*, *Apatura*, *Araschnia*, *Argynnis*, *Brenthis*, *Boloria*, *Euphydryas*, *Inachis*, *Issoria*, *Libythea*, *Limenitis*, *Melitaea*, *Neptis*, *Nymphalis*, *Polygonia*.

New information

Data published in a previous article adds 101 specimens from the *Vanessa* genus. Most species originate regionally from the 9 counties of Transylvania followed by Oltenia and Moldova (3 counties each), Banat and Dobrogea (2 counties each), Crișana, Satu Mare, and Muntenia (1 county each), and the capital Bucharest. The species presented in this paper also include the extinct taxon *Polygonia egea*, Eugen Worrell collection and two species that are endemic to Romania: *Melitaea retyezatica*, Daniel Czekelius collection and *Boloria pales caprathomeridionalis*, both Viktor Weindel collection.

Introduction

Tracing the historical evolution of butterflies from the nymphalid family requires updating the information on the species' long-term collection. Updating this information allows ascertaining in how far environmental and atrophic factors (Fox et al. 2019, Choi et al. 2021) have determined the temporal and spatial abundance and dominance of these species (Ştefanescu et al. 2021). In Romania, as in other European countries, the entomological material held at natural history museums is a valuable resource for researching declining or extinct populations of butterflies. In Romanian museums, the data collected throughout time originates from the entire country and the world and was obtained by exchanges between specialists or from collectors. The data pertaining to specimens of the nymphalid family thus offers information about the collection sites (Burnaz 2002, Capușe and Kovács 1987, Chimișliu 1989, Chimișliu 2010, Chimișliu 2006, Chimișliu 2011, Chimișliu 2012, Ciochia and Barbu 1980, Marcu and Rákossy 2002, Popescu-Gorj 1960, Popescu-Gorj 1964, Popescu-Gorj and Drăhia 1964, Stănescu 2005). Since the nineteenth century, fauna research in Transylvania has been indebted to the work of numerous professional and amateur entomologists with great love for nature. The following natural scientists founded the collections studied in this paper and analyzed and determined the preserved material, thus bringing an important contribution to Lepidopterae research: Daniel Czekelius (1856-1938, Sibiu); Arnold Müller (1884-1937, Sibiu); Eugen Worell (1884-1961, Sibiu), Viktor Weindel (1887-1966, Sibiu); Heinrich Hann von Hannenheim (1895-1971, Sibiu), Rolf Weirauch (1906-1984, Sibiu), Alexei Alexinschi (1899-1966, Iași); Hans Rebel (1861-1940, Viena); László Diószeghy (1877-1942, Arad); Aurelian Popescu-Gorj (1914-1997, București) and Eckbert Schneider (1927) (Székely 2008). A part of the Brukenthal National Museum Sibiu, the Natural History Museum opened in 1895. Owing to its priceless holdings, the Natural History Museum can be currently considered an archive of Lepidoptera biodiversity in Transylvania. It therefore plays a significant role in Romanian and European entomological research.

The museum was founded by German-speaking Transylvanian-Saxon entomologists who collected material in the city of Sibiu, its surroundings, neighboring regions and other Transylvanian locations (Czekelius 1897, Czekelius 1898, Worell 1951, Székely 1996, Székely 2003, Székely 2004) as well as in other geographical regions of Romania. Throughout time, several generations of natural scientists have evaluated and continue to evaluate the data held in these collections (Caradja 1931, Moise 2011a, Moise 2011b, Moise 2011c, Chimișliu 1989, Niculescu 1965, Rákossy et al. 2003, Rákossy 2013, Schneider 1984, Schneider 1996). The Lepidoptera collections are of central importance to the Natural History Museum's patrimony. To date, partial collecting data of the species have been published for the Daniel Czekelius, Eugen Worell, Viktor Weindel, Rolf

Weirauch, Heinrich Hann von Hennenheim, and Eckbert Schneider collections (Czekelius 1898, Stancă-Moise 2017, Stancă-Moise 2018, Stancă-Moise 2019, Stancă-Moise 2020, Stancă-Moise 2021, Stancă-Moise 2022, Török and Cuzepan 2014). The current paper evaluates unpublished data of specimens from the nymphalid family in order to assess this family's historical distribution in Romanian and European fauna.

Materials and methods

The material evaluated in this paper consists of specimens collected in Romania's eight regions (BT, CR, DB, OT, MT, SM, MD, and TR) between 1887–1984. The analysis has also identified specimens collected in Austria, Germany, Croatia, Switzerland, the Republic of Moldova, and Serbia. The species' nomenclature was reviewed by using (Rákosy 2013, Rákosy et al. 2003, Székely 2008) in conformity with the Fauna Europaea taxonomic system (Lampert 1923, Karsholt and Razowski 1996, Van Swaay and Warren 1999). Each species is listed indicating the examined material, collecting data (in the chronological order of years, months, and days), number of specimens, collection sites (including the Romanian county and region), and name of the collector. Question marks are used in cases where information is missing, incomplete, or the writing could not be deciphered. All data originates from museum labels; Romanian place names originally listed in German have been replaced with contemporary Romanian ones.

Abbreviations:

Collectors: Daniel Czekelius (DC), Eugen Worell (EW), Viktor Weindel (VW), Rolf Weirauch (RW), Heinrich Hann von Hennenheim (HH), Eckbert Schneider (ES).

Romanian regions: Banat (BT), Crișana (CR), Oltenia (OT), Muntenia (MT), Moldova (MD), Dobrogea (DB), Satu Mare (SM), Transilvania (TR)

Romania's counties: Arad (AR), Alba (AB), Bistrița-Năsăud (BN), Brașov (BV), Caraș-Severin (CS), Cluj (CJ), Constanța (CT), Covasna (Cv), Galați (GL), Gorj (GJ), Harghita (HR), Hunedoara (HD), Ilfov (IF), Maramureș (MM), Mehedinți (MH), Mureș (MS), Neamț (NT), Satu Mare (SM), Sibiu (SB), Timiș (TM), Tulcea (TL), Vâlcea (VL), Vrancea (VN), București (B).

Degrees of endangerment: Extinct (EX), Critically endangered (CR), Endangered (EN), Vulnerable (VU), Near threatened (NT), Least concern (LC), Endemic (EN).

The analysis of the six collections of lepidoptera under scrutiny in this article focused on 1,865 specimens collected between 1887–1984 and identified 49 species and subspecies of the 90 mentioned in Romania's fauna (Rákosi 2013). Earlier data regarding the *Vanessa* genus is based on 101 specimens, 52 specimens of *V. atalanta* and 49 specimens of *V. cardui* (Stancă-Moise 2022). The species' listing for each collection (Fig. 1) includes the following results: Daniel Czekelius's collection, 14 genera and 49 species (Table 1), Eugen Worrell's collection, 11 genera and 41 species (Table 2), Viktor Weindel's collection, 14 genera and 40 species (Table 3), Heinrich Hann von Hannenheim's collection, 11 genera, 19 species (Table 4), Rolf Weyrauch's collection, 11 genera and 28 species (Table 5), and Eckbert Schneider's collection with 14 genera and 30 species (Table 6). Daniel Czekelius's collection of lepidoptera is the oldest with specimens collected between 1887–1934 in the regions SM and TR, Sibiu County, and nearby locations. This collection consists of 14 genera and 49 species represented by a number of 271 specimens (Fig. 1) and is thus the most complex collection regarding the species' biodiversity. The oldest specimens are *Boloria selene* and *Nymphalis polychloros* and were collected 135 years ago. This collection also includes an endemic species, *Melitaea retyezatica* Diószeghy, 1930, represented by nine specimens collected by László Diószeghy in the Retezat Mountains (Southern Carpathians) between 1919 and 1922. The collectors specified on the labels are Daniel Czekelius, Béla Kiss, Arnold Müller, László

Diószeghy, Friedrich Deubel, Paul Tiltscher, Miklos Tútscher, Kimakowics, Adalbert Prall, Karl Alberti, Karl Petri, and Vincenz Kollar. The species in this collection represent the following degrees of endangerment: 18 taxons VU- 36,74%, 18 taxons NT- 36,74%, 6 taxons LC- 12,24%, 4 taxons EN-8,16%, 2 taxons CR-4,08%, and one endemic taxon, 2,04%.

Table 1

Eugen Worell's collection consists of 394 specimens of 11 genera and 42 species collected between 1888–1959 (Fig. 1). The species originate from Romania's five regions (BT, DB, OT, MD, MT, and TR) and other European countries (Austria, Croatia, Germany, the Republic of Moldova, and Switzerland). The oldest specimen is of the *Nymphalis* polychloros species and was collected in 1888. The collectors listed on the labels are Eugen Worell, Daniel Czekelius, László Diószeghy, Alexei Alexinschi. The results of the endangerment degree analysis of these species are: one species EX-2,38%, *Polygonia egea*, from the site Pula, Istria, Croatia, one species CR-2,38%, 3 species EN-7,15%, 19 species VU-45,23%, 15 species NT-35,71%, and 3 species LC-7,15% (Table 2).

Viktor Weindel's collection contains 385 specimens of 14 genera and 40 species of butterflies of the nymphalid family (Fig. 1). They were collected in the regions OT and TR between 1903–1958, from various sites in Sibiu County, and the Făgăraș Mountains. The oldest specimen was collected in 1903. The collection also contains an endemic species, *Boloria pales* ([Denis&Schiffermüller], 1775) *caprathomeridionalis* Crosson et Popescu-Gorj, that was collected in the Faragas Mountains. Viktor Weindel is the collector listed on the labels. The endangerment level of the specimens is the following: 2 species CR-5%, 3 species EN-7,5%, 15 species VU-37,5%, 15 species NT-37,5% and 5 species LC-12,5% (Table 3).

The fewest specimens are found in Heinrich Hann von Hannenheim's collection consisting of 117 specimens distributed in 11 genera and 19 species (Fig. 1). The oldest specimen is *Bentis hecates* collected in 1928. The species were collected in BT, DB, and TR, and were determined by the collector himself whose name can be found on all labels. Their endangerment level is as follows: 9 species VU-47,37%, 6 species NT-31,58%, and 4 species LC-21,05% (Table 4).

Rolf Weihrauch's collection contains 258 specimens distributed in 11 genera and 28 species (Figure 1) collected from 1922 to 1978. The oldest specimen is *Euphydryas orientalis* collected in 1922. The information on the labels is unreadable. The species were collected in BT, DB, OT, MD, MT, and TR from the Southern Carpathians as well as in Austria. All species were determined by the collector whose name appears on all labels. The analysis of their endangerment level is as follows: 3 taxons CR-10,7%, 2 taxons EN-7,14%, 11 taxons VU-39,28%, 10 taxons NT-35,73%, and 2 taxons LC-7,14% (Table 5).

The newest is Eckbert Schneider's collection. It contains 440 specimens of 14 genera and 30 species (Fig. 1) collected between 1949 and 1984 in BT, CR, DB, OT, MD, and TR as

well as the Western Carpathians. The oldest specimen, was collected in 1949 and is the only *Lybitea celsis* species held by the museum. The endangerment level of the collection's specimens is as follows: 3 specimens EN-10%, 10 specimens VU-33,33%, 12 specimens NT-40%, and 5 specimens LC-16,67% (Table 6).

Fig. 1 represents data pertaining to genus diversity, species and existing specimen number present in each collection. The oldest collection (DC) displays the highest diversity of species. This collection contains 14 genera and 49 species. It is followed in chronological order by EW with 42 species and VW with 40, confirming that, at that time, natural scientists were interested in learning more about and studying the biodiversity of butterflies in SB, the neighboring localities as well as in other TR sites and Romanian regions. The species from the more recent collections (HH and RW) contain a lesser number of genera and species but include more specimens from the DB region. The newest collection (ES) re-confirms the presence of 30 butterfly species of the Nymphalid family captured in six Romanian regions (TR, BT, CR, MD, DB and OT) that are also represented by the largest number of collected specimens.

To facilitate national and international comparison, Fig. 2 represents data referring to the distribution of species by IUCN endangerment numbers (Rákosy 2013), revealing that the majority of the species of all six collections are potentially endangered taxons (NT) followed by non-endangered (LC), vulnerable (VU), critically endangered (EN) extinct (EX), and endemic taxons.

Fig. 3 represents the percentages of the *Nymphalid* family's zoological categories. The highest value (52,30%) pertains to potentially endangered taxons followed by critically endangered (26,23%), non-endangered (14,80), endangered (4,59%), vulnerable 1,18% as well as extinct (0,16%) taxons.

By synthesizing the data referring to the six lepidoptera collections (DC, EW, VW, RW, HH, and ES), I identified 157 sites where the butterflies of the *Nymphalid* family were collected between 1887 and 1984. The species were collected in all of Romania's eighth regions, from 23 counties and the capital of Bucharest, i.e., on 56,1% of Romania's territory. I designed a map based on this data (Fig. 4) that reflects the distribution of species in eighth regions whose counties are listed by collector: (1-DC), 7 counties, BN, BV, CJ, CV, HR, MS, SB, all in the TR and SM regions, (2-EW), 9 counties, BV, CS, CT, GL, GJ, IF, MS, VL, SB, from five of Romania's regions: BT, DB, OT, MD si TR; (3-VW), 7 counties, AB, BN, BV, HR, NT, VL, SB, from three regions: MD, OT, and TR; (4-RW), 16 counties, BN, BV, CJ, CS, CT, CV, GL, GJ, HR, HD, IF, MH, VL, SB, TM and Bucharest, from 6 of Romania's regions: BT, DB, MD, MT, OT, TR and Bucharest; (5-HH), 6 counties, AB, BV, CS, CJ, HR, SB, from two of Romania's regions: BT și TR; (6-ES), 16 counties, AB, AR, BN, BV, CS, CJ, CT, GJ, HD, MH, MS, VL, SB, TM, TL, VN, from six of Romania's regions: BT, CR, DB, OT, MD, TR.

Fig. 5 represents the species collected in other European countries, namely Austria, Croatia, Switzerland, Germany, the Republic of Moldova, and Serbia.

Romania's territory has a surface of 237.500 km² that comprises a variety of geographic forms, from Alpine meadows to the Danube Delta's hydrological profile. They are populated by a diverse fauna of lepidoptera containing over 200 diurnal butterfly species. Romania's South, especially the South-East and South-West (BT and DB) is the region with the highest diversity of lepidoptera in the country (Székely 2008) and at the same time the Northern limit of the distribution of their Balkan species in Europe (Ştefănescu et al. 2013, Wildman et al. 2022). Cazanele Dunării, the Danube's gorge, connects the Carpathian and Balkan Mountains. This geological formation has facilitated the entry of Balkan-type montainous-subalpine elements into Romania, as far as the Retezat Mountains, for instance *Melitaea retyezatica* Diöszeghy. Given that the Carpathian Mountains do not exceed 2,500 m in height, their butterfly fauna is characterized mostly by subalpine, boreo-alpine, and boreo-montane species (Székely 2008). Most endemic species have formed in the isolated, high regions of the Carpathian Mountains. They were analyzed and included in the collections as follows: *Melitaea retyezatica* Diöszeghy, 1930, and *Boloria pales* ([Denis&Schiffermüller], 1775) *caprathomeridionalis* Crosson et Popescu-Gorj. The Romanian Catalogue of Lepidoptera records the presence of 90 species of which the Nymphalids are distributed as follows: BT (78 species), CR (60 species), TR (78 species), SM (66 species), OT (73 species), MT (77 species), MD (68 species), and DB (62 species) (Rákosy 2013). I have identified 49 species in the collections, which represent 54,44% of the species in Romania's fauna. These species are distributed by counties as follows: BT with the counties (CS and TM); CR (AR); DB (CT and TL), MD (GL, NT, and VR); MT (IF); OT (GJ, MH, and VL); SM (SM), TR (AB, BN, BV, CV, CJ, HR, HD, MS, SB) and the capital Bucharest. Based on synthesizing the collection data and on previously published data on species of this family (Stancă-Moise 2021), the present article presents 16 genera and 1966 specimens of the Nymphalid family collected in Romania since 137 years ago.

The article illustrates the biodiversity of the *Nymphalid* family and their historical evolution in Romania and Europe, thus bringing an important historical, scientific, and biogeographic Council Directive 1992 contribution to the study of butterflies. With the earliest data from 1887, my research complements current scholarship on the presence, diversity, and distribution of the *Nymphalid* family in Romania until 1984. Alongside other rare, extinct, or endangered species (Fig. 3), the presence of *Nymphalid* species with various endangerment levels in the patrimony of the Natural History Museum Sibiu enhances the scientific value of the museum's collections and confirms their significance for ascertaining the biodiversity and distribution of the species throughout time. Future research will include digitizing the museum's butterfly collection to facilitate the access to the collected specimens for specialists searching for historical data on the species.
